A residual gas analyzer (RGA) is a small and usually rugged mass spectrometer, typically designed for process control and contamination monitoring in vacuum systems. When constructed as a quadrupole mass analyzer, there exist two implementations, utilizing either an open ion source (OIS) or a closed ion source (CIS). RGAs may be found in high vacuum applications such as research chambers, surface science setups,

Residual Gas Analyzers The new 120, 220 and 320 amu residual gas analyzers from SRS offer increased mass range, better performance and new capabilities like built-in analog I/O. Building on

Within the RGA, gas is ionized and the measured quantity is the ion current as a function of ion mass-to-charge ratio Basic analysis of gas composition commonly is performed by examining peaks at
